1.6 Accuracy and Estimation

Name _____ Period ____ Date _____

Algebra I 1.6 (30-minute plan) · Student sheet

I can…

- estimate results with an appropriate level of accuracy.
- decide how many items I need and round correctly in context.
- choose an appropriate approximation for a measurement.

Vocabulary · fill in the missing word

Estimate — an _____ answer found by rounding

Accuracy — how close a measured or _____ value is to the actual value

Round up in context — when you need _____ (bags, buses, cans), always round up

Part 1 · Notes and examples (fill in each note, then work the example)

Example 1

Estimate each result.

a. 19.8×5.1 b. $\sqrt{50}$

Round up: When you need enough of something, always round _____.

Accuracy: A measurement can be only as accurate as the _____ used to measure it.

Final answers: Round a final answer to a _____ level of accuracy for the situation.

Example 2

A student says the hallway is 152.387 meters long. Is that an appropriate measurement? What would be better?

Part 2 · Partner practice

Partner practice

Estimate $49.7 \div 9.8$.
