1.5 Solving Linear Systems

Name _____ Period ____ Date _____

Algebra II 1.5 (30-minute plan) · Student sheet

I can…

- solve a system of three linear equations by elimination.
- solve systems by substitution and recognize systems with no solution or infinitely many solutions.
- write and solve three-variable systems for real-life problems.

Vocabulary · fill in the missing word

Linear equation in three variables — ax + by + cz = d; its _____ is a plane

Solution of a system — an _____ triple (x, y, z) that makes every equation true

No solution — _____ gives a false statement, such as 0 = 5

Infinitely many solutions — _____ gives an identity, such as 0 = 0

Part 1 · Notes and examples (fill in each note, then work the example)

Solution: A solution of a three-variable system is an ordered _____.

Elimination: Use two equations to eliminate a variable, then a _____ pair to eliminate the _____ variable.

Example 1

Solve the system.

$x - 2y + z = -11$

$3x + 2y - z = 7$

$-x + 2y + 4z = -9$

Special cases: 0 = 5 means _____; 0 = 0 means _____.

Example 2

Solve the system.

$x + y + z = 2$

$5x + 5y + 5z = 3$

$4x + y - 3z = -6$

Part 2 · Partner practice

Partner practice

Solve the system.

$x + y + z = 6$

$x - y + z = 2$

$2x + y - z = 1$
