3.4 Complex Numbers

Name _____ Period ____ Date _____

Algebra II 3.4 (30-minute plan) · Student sheet

I can…

- define and use the imaginary unit i.
- add, subtract, and multiply complex numbers.
- divide complex numbers and find complex solutions of quadratic equations.

Vocabulary · fill in the missing word

Imaginary unit i — i = _____, so $i^2 = -1$

Complex number — a + bi, where a and b are _____; a is the real part and b is the imaginary part

Imaginary number — a + bi with $b \neq 0$; _____ imaginary if a = 0

Complex conjugates — a + bi and a − bi; their _____ is $a^2 + b^2$, a real number

Part 1 · Notes and examples (fill in each note, then work the example)

The imaginary unit: i = _____, i^2 = _____

Example 1

a. Find $\sqrt{-25}$ and $\sqrt{-18}$. b. Solve $x^2 + 16 = 0$.

Complex numbers: A complex number has the form _____.

Example 2

Simplify.

a. $(7 + 3i) - (2 - 5i)$ b. $(-4 + i) + (6 - 2i)$

Complex conjugates: The conjugate of a + bi is _____. To divide, multiply by the _____ of the denominator.

Example 3

Divide $\frac{5 + i}{2 - i}$.

Part 2 · Partner practice

Partner practice

Multiply $(1 - i)(3 + 2i)$.
