P.5 Exponential and Logarithmic Functions

Name _____ Period ____ Date _____

AP Calculus P.5 (30-minute plan) · Student sheet

I can…

- graph exponential functions and give their domain, range, and asymptote.
- explain what the number e is and use natural logarithms.
- find the domain of a logarithmic function and solve exponential and logarithmic equations.

Vocabulary · fill in the missing word

Exponential function — $f(x) =$ _____, where $a > 0$ and $a \neq 1$

The number e — the base of the _____ function whose tangent line at (0, 1) has slope 1; $e \approx 2.718$

Logarithmic function — $y =$ _____ $= a^y$, where $a > 0$, $a \neq 1$, and $x > 0$

Natural logarithm — $\ln x =$ _____

Part 1 · Notes and examples (fill in each note, then work the example)

$f(x) = a^x$: domain all real numbers, range $(0, \infty)$, horizontal asymptote $y = 0$, and the graph contains (0, 1), (1, a), and (−1, _____).

Example 1

Use transformations to graph f(x) = 2^(x + 2). Give the domain, range, and asymptote.

The number e: the tangent line to $y = e^x$ at (0, 1) has slope _____.

Logarithms: $y = \log_a x$ means $x =$ _____; the domain of $\log_a x$ is $(0, \infty)$.

Example 2

Find the domain of each function.

a. $F(x) = \log_2 x^2$

b. $g(x) = 8 + 5 \ln(2x + 3)$

c. $f(x) = \ln(x - 1)$

Inverse properties: $\ln e^x = x$ for all real x, and e^(ln x) = _____ for $x > 0$.

Example 3

Solve.

a. $3^{(x^2)} = 9^x$

b. $e^{(3x)} = \frac{e^2}{e}^x$

Part 2 · Partner practice

Partner practice

Solve $\log_3(3x - 2) = 2$.
