12.1 Cross Sections of Solids

Name _____ Period ____ Date _____

Geometry 12.1 (30-minute plan) · Student sheet

I can…

- tell whether a solid is a polyhedron and name it.
- use Euler's Theorem to find the number of faces, vertices, or edges.
- describe the shape of a cross section of a solid.

Vocabulary · fill in the missing word

Polyhedron — a solid that is bounded by _____, called faces

Face — a polygon that forms a side of a _____

Edge — a segment where two faces of a _____ meet

Vertex — a point where three or more edges of a _____ meet

Cross section — the _____ of a plane and a solid

Part 1 · Notes and examples (fill in each note, then work the example)

Prisms and pyramids: a prism has two congruent, parallel _____; a pyramid has one base, and its lateral faces meet at a _____.

Example 1

Tell whether each solid is a polyhedron. If it is, name it.

a. two parallel pentagon bases and five rectangle faces

b. a cone

c. a square base and four triangle faces that meet at a point

Euler's Theorem: for any polyhedron, F + V = _____

Example 2

A polyhedron has 12 faces and 30 edges. How many vertices does it have?

Cross section: the shape formed where a _____ slices through a solid.

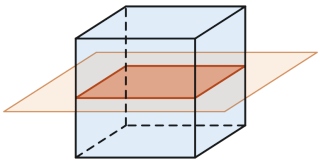

Example 3

Describe the shape of each cross section.

a. a cube cut by a plane parallel to a face (shown)

b. a cylinder cut by a vertical plane through the centers of its bases

c. a cone cut by a plane parallel to its base

Part 2 · Partner practice

Partner practice

Describe the cross section of a square pyramid cut by

a. a plane parallel to its base

b. a vertical plane through its vertex and the midpoints of two opposite base edges
