1.2 Measuring and Constructing Segments

Name _____ Period ____ Date _____

Geometry 1.2 (30-minute plan) · Student sheet

I can…

- find the length of a segment on a number line or ruler.
- tell whether two segments are congruent.
- use the Segment Addition Postulate to find lengths.

Vocabulary · fill in the missing word

Postulate — a rule that is _____ without proof

Congruent segments — segments that have the same _____

Between — B is between A and C when A, B, and C are _____ and B is on $\overline{AC}$

Part 1 · Notes and examples (fill in each note, then work the example)

Ruler Postulate: the distance between two points on a number line is the _____ of the difference of their coordinates: $AB = |x_2 - x_1|$.

Example 1

On a number line, A is at −3 and B is at 5. Find AB.

Congruent segments: $\overline{AB} \cong \overline{CD}$ means the segments have the same _____: AB = CD.

Segment Addition Postulate: if B is between A and C, then AB + _____ = AC.

Example 2

B is between A and C. AB = 9 and BC = 13. Find AC.

Example 3

M is between L and N. LM = 2x, MN = x + 7, and LN = 25. Find x, LM, and MN.

Part 2 · Partner practice

Partner practice

X is between W and Y. WX = 3x − 1, XY = 2x + 4, and WY = 28. Find x, WX, and XY.
