5.3 Proving Triangle Congruence by SAS

Name _____ Period ____ Date _____

Geometry 5.3 (30-minute plan) · Student sheet

I can…

- identify the included angle between two sides.
- use SAS to decide whether two triangles are congruent.
- write a proof that uses SAS.

Vocabulary · fill in the missing word

Included angle — the angle formed by two sides of a _____

SAS Congruence Theorem — if two sides and the included angle of one triangle are congruent to two sides and the included angle of another, the _____ are congruent

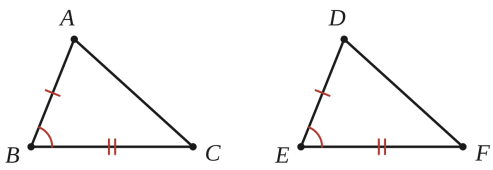

Part 1 · Notes and examples (fill in each note, then work the example)

Included angle: the angle _____ two sides (formed by them).

SAS Congruence Theorem: if two sides and the _____ angle of one triangle are congruent to two sides and the included angle of a second triangle, then the triangles are congruent.

Example 1

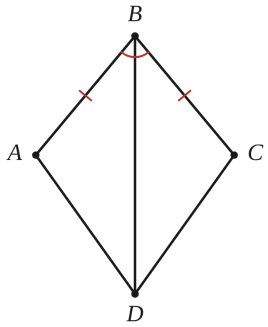

Can you prove the triangles congruent by SAS? If so, write the congruence statement.

Free parts: a shared side is congruent to itself by the _____ Property, and vertical angles are congruent.

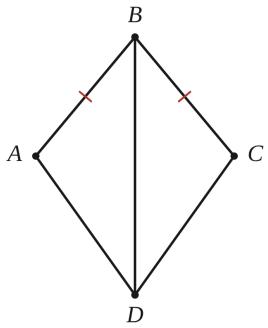

Example 2

$\overline{AB} \cong \overline{CB}$ and $\angle ABD \cong \angle CBD$. Are $\triangle ABD$ and $\triangle CBD$ congruent? Explain.

Example 3

Given: $\overline{AB} \cong \overline{CB}$ and $\overline{BD}$ bisects $\angle ABC$. Prove: $\triangle ABD \cong \triangle CBD$.

Part 2 · Partner practice

Partner practice

Given: M is the midpoint of $\overline{AB}$ and of $\overline{CD}$ (the segments cross at M). Prove: $\triangle AMC \cong \triangle BMD$.
