6.1 Perpendicular and Angle Bisectors

Name _____ Period ____ Date _____

Geometry 6.1 · Student sheet

I can…

- use the Perpendicular Bisector Theorem and its converse to find lengths.
- use the Angle Bisector Theorem and its converse to find lengths and angle measures.
- write an equation of a perpendicular bisector.

Vocabulary · fill in the missing word

Equidistant — the same _____ from two or more objects

Perpendicular bisector — a line, segment, or ray that is perpendicular to a segment at its _____

Distance from a point to a line — the length of the _____ segment from the point to the line

Angle bisector — a ray that divides an angle into two _____ angles

Part 1 · Patty paper discovery

Fold 1. Draw a segment $\overline{AB}$. Fold A onto B. The crease is the perpendicular bisector. Mark three points on the crease and measure.

Point on the crease	Distance to A	Distance to B

What I notice:

Fold 2. Draw an angle. Fold one side onto the other. The crease is the angle bisector. Mark a point on it and measure the **perpendicular** distance to each side.

Point on the crease	Distance to side 1	Distance to side 2

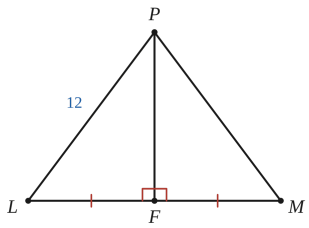

What I notice:

Part 2 · Notes and examples (fill in each note, then work the example)

Perpendicular Bisector Theorem: If a point is on the perpendicular bisector of a segment, then it is _____ from the endpoints of the segment.

Example 1

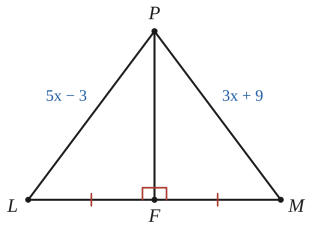

$\overline{PF}$ is the perpendicular bisector of $\overline{LM}$. Find PM.

Converse: If a point is equidistant from the endpoints of a segment, then it is on the _____ _____ of the segment.

Example 2

$\overline{PF}$ is the perpendicular bisector of $\overline{LM}$. Find PL.

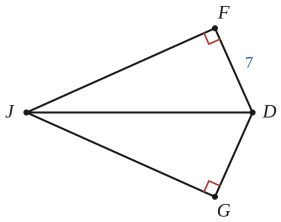

Angle Bisector Theorem: If a point is on the bisector of an angle, then it is equidistant from the two _____ of the angle.

Distance from a point to a line: The distance from a point to a line is the length of the _____ segment from the point to the line.

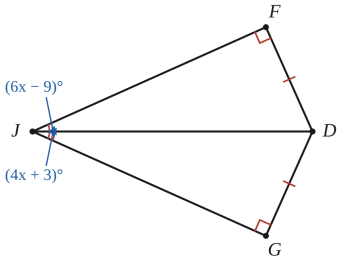

Example 3

$\overline{JD}$ bisects $\angle FJG$. Find DG.

Example 4

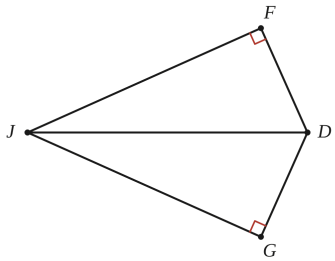

Find m$\angle FJG$.

Converse: If a point is in the interior of an angle and is equidistant from the two sides, then it lies on the _____ of the angle.

Example 5

Can you conclude that $\overline{JD}$ bisects $\angle FJG$? Explain.

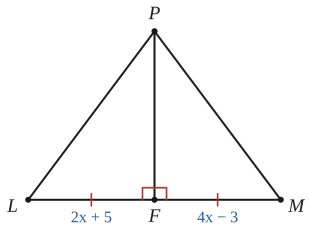

Example 6

Write an equation of the perpendicular bisector of the segment with endpoints (−2, 3) and (4, 1).

Part 3 · Partner practice

Partner 1

$\overline{PF}$ is the perpendicular bisector of $\overline{LM}$. Find LM.

Partner 2

$\overline{JD}$ bisects $\angle FJG$. Find DF.
