6.1 Perpendicular and Angle Bisectors

Name _____ Period ____ Date _____

Geometry 6.1 (30-minute plan) · Student sheet

I can…

- use the Perpendicular Bisector Theorem and its converse to find lengths.
- use the Angle Bisector Theorem and its converse to find lengths and angle measures.
- write an equation of a perpendicular bisector.

Part 1 · Notes: fill in the blanks

Perpendicular Bisector Theorem: If a point is on the perpendicular bisector of a segment, then it is _____ from the endpoints of the segment.

Converse: If a point is equidistant from the endpoints of a segment, then it is on the _____ _____ of the segment.

Angle Bisector Theorem: If a point is on the bisector of an angle, then it is equidistant from the two _____ of the angle.

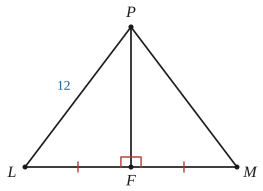

Converse: If a point is in the interior of an angle and is equidistant from the two sides, then it lies on the _____ of the angle.

The distance from a point to a line is the length of the _____ segment from the point to the line.

Part 2 · Examples (work them with the class)

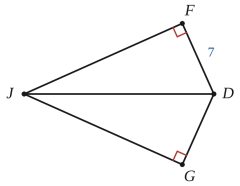

Example 1

$\overline{PF}$ is the perpendicular bisector of $\overline{LM}$. Find PM.

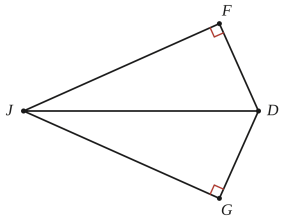

Example 2

$\overline{JD}$ bisects $\angle FJG$. Find DG.

Example 3

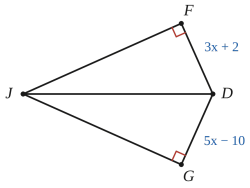

Can you conclude that $\overline{JD}$ bisects $\angle FJG$? Explain.

Part 3 · Partner practice

Partner practice

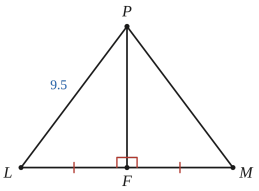

$\overline{JD}$ bisects $\angle FJG$. Find DF.

Part 4 · On your own: choose 2 of 3

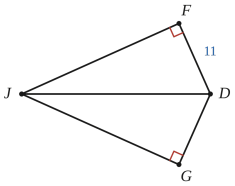

Problem 1

$\overline{PF}$ is the perpendicular bisector of $\overline{LM}$. Find PM.

Problem 2

$\overline{JD}$ bisects $\angle FJG$. Find DG.

Problem 3

Find m$\angle FJG$.
