9.4 Independent and Dependent Events

Name _____ Period ____ Date _____

Algebra I 9.4 · Student sheet

I can…

- tell whether two events are independent or dependent.
- find the probability of independent events.
- find the probability of dependent events.

Part 1 · With or without?

Your bag has 3 red and 2 blue chips. Do each round 10 times. Record R for red and B for blue.

Round	1	2	3	4	5	6	7	8	9	10	Both red
With replacement											
Without replacement											

Class totals: with replacement _____ out of _____ without replacement _____ out of _____

Which round gave “both red” more often? Why?

Part 2 · Notes: fill in the blanks

Independent: one event _____ the probability of the other. P(A and B) = _____

Dependent: P(A and B) = P(A) · _____

With replacement → _____. Without replacement → _____.

Without replacement, the second fraction has one fewer in the _____ and in the _____.

Part 3 · Examples (work them with the class)

Example 1

Tell whether the events are independent or dependent.

a. You roll a die and flip a coin.

b. You draw a card, don’t put it back, and draw another card.

c. A class elects a president, then elects a vice president from the other students.

Example 2

You spin a spinner with four equal sections (red, blue, yellow, green) and roll a die. What is the probability of red and a 6?

Example 3

A drawer has 4 black socks and 6 white socks. You pick two socks at random. Find P(both black)

a. with replacement. b. without replacement.

Example 4

Events A and B are independent. P(B) = 0.4 and P(A and B) = 0.1. Find P(A).

Part 4 · Partner practice

Partner 1

A jar has 5 red and 3 green candies. You eat one at random, then take another. What is the probability that both are green?

Partner 2

The probability of rain on Saturday is 0.3, and on Sunday it is 0.5. Assume the days are independent. Find the probability of rain on both days and the probability of no rain either day.
